		e selected multi-play fos.xml and as per (				
	appear greyed o	the specified option out in the scenario se values are defined	etup menu so the	player cannot char		
	specify any/all c victory type it m	fferent victory types of them. Each victory neans the player/Al no defined victory type of out.	<pre>/ must be specifie has the possibility</pre>	d on it's own line li of winning the gar	ke the last few s me that way. De	ettings. By defining fault is no victory

	as zero[0]) but you can start the scenario on a different turn number by defining this variable. EG: WW2 started September 1939. You define the calendar as CALENDAR_MONTHS. The first turn is always the first calendar segment (in this case January). To specify September you would set GameTurn=8.
	<b>MaxTurns</b> = the maximum number of turns in the scenario. This must be set higher than GameTurn (obviously can't start after the end). EG: You have a scenario that you want to run for 300 years, and your calendar is set to CALENDAR_YEARS. Setting MaxTurns=300 will end the game with score victory after turn 299 (remember 0 is the first turn).
	<b>MaxCityElimination=</b> the number of cities a multi-player player can lose before losing the game. EG: MaxCityElimination=3 means that each player will lose the game if they lose 3 cities.
	<b>TargetScore</b> = the score a player must achieve to win the game. For an example the Desert War scenario uses TargetScore=6 as there are 6 objective cities in the game. If one team holds all 6 cities then they win the game. By itself you can define the actual score a player must achieve (in the score list on the right of the interface) but coupled with python can be an extremely powerful scoring utility. You must have Victory=VICTORY_SCORE for this method to work.
	<b>StartYear=</b> the physical date that the game begins in. EG: WW2 starts in 1939 so you would set StartYear=1939. To specify a BC date use a negative number. Default is -4000 (4000BC).
	<b>Description</b> = the text displayed in the scenario menu when the scenario is selected. It displays under the map window.
	<b>ModPath=</b> the path to the folder containing your modified files. Only set this if you have also modified xml or python files. Otherwise save you WBS file to PublicMaps and leave this line blank. If set it will force the scenario to use the settings in the mod folder defined rather than the default settings of Civ4. EG: ModPath=Mods\MyMod\.
	This ends the description of ALL settings possible in the BeginGame section of the WBS file.
REPORT	QUOTE) QUOTES (REPL
October 31, 2005, 21:54	
Dale	BeginTeam
	This section of the WBS file describes each team (not player) in the scenario. In SP games you can even create teams. Please note: every player MUST be part of a team, even if there is only one player in the team. Below is a list of ALL possible variables, and the values they can have.

Tech= the list of technologies that the team begins with. By defining a list of techs here you control how much prior knowledge each team will begin with. EG: Tech=TECH\_MYSTICISM will give the tech mysticism to the team. These are defined in CIV4TechInfos.xml.

ContactWithTeam= the amount of diplomatic contacts the team has. Each diplomatic contact is defined seperately. EG: ContactWithTeam=0 and on the next line ContactWithTeam=1 will enable diplomacy between the two teams.

AtWar= the list of teams that this team begins at war with. EG: AtWar=1 means this team will be at war with team 1 at the onset of the scenario.

PermanentWarPeace= the list of teams that the status of war/peace cannot be changed for. EG: Team 0 has AtWar=1 and PermanentWarPeace=1 and PermanentWarPeace=2. This means team 0 cannot sue for peace with team 1 and cannot declare war on team 2.

OpenBordersWithTeam= the list of teams that an open border agreement exists with at the start of the game. This can be cancelled later.

DefensivePactWithTeam= the list of teams that a defensive pact exists at the start of the game. This can be cancelled later unless permanent war peace is defined.

ProjectType= the projects existing in the team. This way you can define if a team project exists in a team at the start of the game. These values are defined in CIV4ProjectInfo.xml.

RevealMap= the state of the team knowing the whole map at the start of the game. Valid options are 0 (don't know map) and 1 (knows map). If left out then default is 0.

This gives you all the options available to teams. You need to make sure if you add an entry to one team that the corresponding entry is in the other team too. EG: Team 0 has ContactWithTeam=1 and team 1 has ContactWithTeam=0.

## BeginPlayer

This section defines all the player settings for the game. These settings will allow you to change all behaviour for the players.

CivDesc= the descriptive name to give the civ. This is the name that civ takes on in the game. EG: CivDesc=Kingdom of Ghent.

ICAL SOL
frinn 1

Local Time: 21:02 Local Date: April 13, 2009 Join Date: Dec 2000

Posts: 3,867

**CivShortDesc=** the short descriptive name to give the civ. This is the short name that civ is known as. EG: CivShortDesc=Ghent.

**LeaderName=** the name of the leader of that civ. This name is what the king or emporer or whoever is called. EG: LeaderName=Chief Two-Dogs.

**CivAdjective=** the descriptive name of the civ. This can be determined by completing this sentance: "I am who leads the which is populated by the people." EG: I am Chief Tow-Dogs who leads the Kingdom of Ghent which is populated by the Ghentese people.

FlagDecal= the DDS file of the civ's flag. These are defined in the folder ../Art/Interface/TeamColor/. EG: FlagDecal=Art/Interface/TeamColor/FlagDECAL\_UK.dds

WhiteFlag= the setting which gives the civ's flag (what the units hold) a white background or the background of the colour of the civ. Valid settings are 1 (use white) or 0 (use civ's default colour).

**LeaderType**= the leader settings to use for this civ. These values are defined in CIV4LeaderHeadInfos.xml. EG: LeaderType=LEADER\_ELIZABETH.

**CivType=** the civilization to use for this player. These values are defined in CIV4CivilizationInfos.xml. EG: CivType=CIVILIZATION\_ENGLAND.

**Team=** the team number that this civ is part of. The team settings are defined in BeginTeam above in the WBS file. More than one civ can be part of a team, and every civ must be part of a team (even by itself). EG: Team=1

Handicap= the default handicap that the AI takes if no human takes this civ. These values are defined in CIV4HandicapInfo.xml. EG: Handicap=HANDICAP\_NOBLE

**Color=** the default colour of the civ. The colour defines the civ's border colour, the colour of the name, etc. These values are defined in CIV4PlayerColorInfos.xml. EG: Color=PLAYERCOLOR\_CYAN

**ArtStyle=** the style of art that the civ uses. This values defines building graphics and tile improvements. These values are defined in GlobalTypes.xml.

**PlayableCiv=** the setting to turn on whether this civ can be played by a human or not. Valid values are 0 (Al only) or 1 (playable by human).

**MinorNationStatus** = the setting to determine if a civ is a minor nation in relation to diplomacy. Valid values are 0 (full power civ) or 1 (minor nation civ that won't do diplomacy with anyone).

**StartingGold=** the amount of gold that civ starts with in the scenario.

**StartingX**= the X-axis location of the starting plot of this civ. Only valid if there are no cities on the map for this civ.

**StartingY** = the Y-axis location of the starting plot of this civ. Only valid if there are no cities on the map for this civ.

**StateReligion=** the State Religion that the civ starts the game with. These values are defined in CIV4ReligionInfo.xml.

**StartingEra**= the era that the civ begins the game in in regards to graphics. These values are defined in CIV4EraInfos.xml.

**CivicOption=XXXX**, **Civic=YYYY** where XXXX is the civic category and YYYY is the actual civic. This setting forces the civ to that civic at the start of the game. Civic options are defined in CIV4CivicOptionInfos.xml and civics are defined in CIV4CivicInfos.xml. EG: CivicOption=CIVICOPTION\_GOVERNMENT, Civic=CIVIC\_UNIVERSAL\_SUFFRAGE

AttitudePlayer=XXX, AttitudeExtra=YYY where XXX is the player number affected and YYY is the amount to change diplomatic attitude towards that player. EG: AttitudePlayer=1, AttitudeExtra=-15 will change this civ's attitude towards player 1 by -15.

**CityList**= the name of cities that the civ has available when founding new cities. EG: CityList=Shanghai will cause this civ to use Shanghai as a city name. You can have as many pre-defined city names using CityList as you wish, each one on a separate line. If these are left out the default city names are used.

This covers all the settings possible in the BeginPlayer section of the WBS file. Each seperate player must be defined. Remember, every player must be part of a team, even if by themselves.

REPORT

BeginMap

October 31, 2005, 21:56

This section describes the map settings to the Civ4 engine. Here you can define all about the map and how it plays. Below is a list of ALL possible variables, and the values they can have.

grid width= the width of the map in number of plots. NOTE: The grid width begins at zero so the first column

	of plots will be 0 NOT 1. However you still define grid width in real terms. EG: Map is 20 tiles wide grid
	width=20.
trant in	<b>grid height=</b> the height of the map in number of plots. NOTE: The grid height begins at zero so the first row of plots will be 0 NOT 1. However you still define grid height in real terms. EG: Map is 20 tiles high grid height=20.
Local Time: 21:02 Local Date: April 13, 2009	<b>top latitude</b> = the latitude value of the top row of plots. By default this value is 90 (the north pole) which means the polar ice caps will be placed on the map by the engine in zoomed out globe view. If you specify less (EG: top latitude=45) then the polar ice caps will not be displayed.
Join Date: Dec 2000 Location: Melbourne	<b>bottom latitude</b> = the latitude value of the bottom row of plots. By default this value is 90 (the south pole) and works exactly like top latitude does.
Posts: 3,867	<b>wrap X=</b> the wrapping setting on the x-axis (horizontal). By default this is 1 (map wraps at the left-right edges). If you set this value to 0 then the x-axis does not wrap. Combined with the y wrap setting you can create flat maps, doughnut maps or maps that wrap left-right or top-bottom.
	<b>wrap Y=</b> the wrapping setting on the y-axis (vertical). By default this is 0 (no wrapping at the top-bottom edges). This setting works the same as wrap X.
	world size= the map size setting of the scenario. This is usually set when you setup the map in the WBS in- game. However you may want to change it. These values are defined in CIV4WorldInfo.xml.
	climate= the climate setting of the game. These are the same as setting in a new game setup from the main menu. These values are defined in CIV4ClimateInfo.xml.
	<b>sealevel</b> = the sea level setting of the game. These are the same as setting in a new game setup from the main menu. These values are defined in CIV4SeaLevelInfo.xml.
	<b>num plots written=</b> the total number of plots in the game. This value is derived by multiplying the values from <i>grid width</i> and <i>grid height</i> above. EG: grid width=50 and grid height=50 then num plots written=2500 (50 * 50).
	This is all the settings available to setup a map within the WBS file. As you can see the map engine is very flexible.
REPORT	QUOTE) QUOTE* REPLY

Dale	<b>BeginPlot</b> This section will fill in the last section of the WBS file: the Plots section. Each plot on the map will have its own BeginPlotEndPlot section. This is going to be a big one, with lots of nested explanations. So strap yourself in for the ride for the ride <b>x=XXX,y=YYY</b> where XXX = the column (vertical) that the plot resides in on the map and YYY = the row (being the test before the rest of the map and YYY).
the entries of the second s	(horizontal) that the plot resides in on the map. Columns begin at 0 (zero) on the left edge of the map and increase by 1 to the right. Rows begin at 0 (zero) on the bottom edge of the map and increase by 1 upwards. Bottom right plot is 0,0 and top right plot is (mapwidth - 1),(mapheight - 1).
Local Time: 21:02 Local Date: April 13, 2009	<b>Landmark</b> = the setting to point to a sign or landmark on the map. The value is the text to be displayed by the landmark. EG: Landmark=This is a landmark!
Join Date: Dec 2000	ScriptData = the pointer to a plot script. In the WBS it is possible to assign a script to a city. This reference does not go into these scripts.
Location: Melbourne	
Location: Melbourne Posts: 3,867	<b>isNOfRiver</b> and <b>isWOfRiver</b> are the two settings to place a river through this plot. They do not require a value being flags to the graphics engine. isNOfRiver (is north of river) defines the river as being on the bottom edge of the plot and isWOfRiver (is west of river) defines the river as being on the right edge of the plot. These settings MUST be used in conjunction with RiverNSDirection or RiverWEDirection.
Posts: 3,867	value being flags to the graphics engine. isNOfRiver (is north of river) defines the river as being on the bottom edge of the plot and isWOfRiver (is west of river) defines the river as being on the right edge of the plot.

StartingPlot is the flag used by the Civ4 engine to define a civilizations starting location. This will assign a random civ from the scenario at this location. If you wish to specify that a civ gets the same starting location</pre>

CIV4ImprovementInfos.xml. EG: ImprovementType=IMPROVEMENT\_MINE

**FeatureType=XXX**, **FeatureVariety=YYY** where XXX is the terrain feature to place on this plot and YYY is which variety of the valid terrain feature to place. Forests is an example of a terrain feature, while the FeatureVariety will determine which version of the forest is placed (pines, hardwood, etc). These are defined in CIV4FeatureInfos.xml. EG: FeatureType=FEATURE\_FOREST, FeatureVariety=1

**RouteType=** the setting to place a particular transportation type in the plot. Routes are also important as they define trade routes too. These settings are defined in CIV4RouteInfos.xml. EG: RouteType=ROUTE\_RAILROAD

**TerrainType=** the base terrain type of the plot. These values are defined in CIV4TerrainInfos.xml. EVERY plot will have a TerrainType setting. EG: TerrainType=TERRAIN\_GRASS

**PlotType=** the setting which determines the height of the plot. This basically determines if the plot is below sea level, a hill, a mountain, or flat terrain. Valid values are 0=mountain, 1=hilly, 2=flat, 3=below sea level.

BeginUnit is the subsection that defines a unit at this plot. A unit is defined in the following way:

oue.		
	BeginUn:	it
		UnitType=AAAA, UnitOwner=BBBB
		Level=CCCC, Experience=DDDD
		PromotionType=EEEE
		UnitAIType=FFFF
	EndUnit	

Where:

AAAA = the unit type that is at the plot. These values are defined in CIV4UnitInfos.xml. BBBB = the unit owner (the player number who owns this unit). The first player is player 0 with the last possible player being player 17 (equals 18 players). CCCC = the experience level of the unit. Each level means one more promotion is possible. EG: Level=0

means no promotions, Level=2 means 2 promotions. DDDD = the actual experience of the unit. This reflects how many points it has gained towards the next

promotion level.

EEEE = the promotions this unit has. You assign as many PromotionType lines as Levels given to the unit above. These values are defined in CIV4PromotionInfos.xml.

FFFF = the usage of the unit for the AI. Assigning the correct UnitAIType for a unit is important as it tells the AI what the unit is used for. EG: Settler units should get UnitAIType=UNITAI\_SETTLE

BeginCity is the subsection that defines a city at this plot. A city is defined in the following way:

BeginCity CityOwner=AAAA CityName=BBBB CityPopulation=CCCC ProductionUnit=DDDD ProductionBuilding=EEEE ProductionProject=FFFF ProductionProcess=GGGG BuildingType=HHHH ReligionType=HHHH ReligionType=JJJJ ScriptData=KKKK PlayerLLLLCulture=MMMM EndCity

Where:

Code

AAAA = the city owner. Similar to unit owner it is the value between 0 and 17 of the player who owns this city.

BBBB = the name of the city. This can be any value. EG: CityName=My City

CCCC = the starting population in the city. This is how many population points the city starts with.

DDDD = the unit that the city is building at game start. Only one Production type is used (the first one in the city definition). These values are defined in CIV4UnitInfos.xml

EEEE = the building that the city is building at game start. Only one Production type is used (the first one in the city definition). These values are defined in CIV4BuildingInfos.xml

FFFF = the project that the city is building at game start. Only one Production type is used (the first one in the city definition). These values are defined in CIV4ProjectInfo.xml

GGGG = the process (science/wealth/culture) that the city is building at game start. Only one Production type is used (the first one in the city definition). These values are defined in CIV4ProcessInfo.xml

HHHH = the buildings that the city already has at game start. Any number of BuildingTypes can be defined on separate lines. These values are defined in CIV4BuildingInfos.xml

IIII = the religions that the city has at game start. Any number of religions can be defined on separate lines. These values are defined in CIV4RelgionInfos.xml

JJJJ = the Holy City of the defined religions. Any number of these can be defined on separate lines. These values are defined in CIV4ReligionInfos.xml

KKKK = any scripts assigned to the city. This analysis does not go into these scripts.

LLLL & MMMM = the starting culture that the city has. LLLL is the player number and MMMM is the amount of culture. EG: Player3Culture=100 means this city begins with 100 points of player 3's culture. You can define a culture level for any number of players.

**TeamReveal** = the list of teams that this plot is revealed to at the start of the game. The teams in this list will be able to view the plot, but fog of war may still be over the plot. The list is simply a list of the team numbers seperated by a comma. The list MUST end with a comma. EG: TeamReveal=TeamReveal=0,1,2,3,

	(1,2), etc.

laquiladora	Got another question, kinda related to the WBS.
P MA CtPCtP	When i load up the short scenario i made and play i think 3 or 4 turns they always found a religion.
nperor .ocal Time: 06:02 .ocal Date: April 13, 2009	I even placed the city with WB and gave it a religion, for example id start the scen (no cities placed), place Moscow with the WB then give it Christianity religion, then 3 or 4 turns in itll say ive founded Taoism for example.
loin Date: Jun 2001 Location: Monterrey, Mexico	All civs have techs upto and including some from the modern era, but they all found different religions a few turns in.
Posts: 7,192	Ive looked at your Desert War scen which i notice removes religion but i ideally want to keep religion in for now, but avoid the above somehow. Even the ones where i set the state religion in the WBS itll still found a new different religion a few turns in.
<b>6</b> *	new unreferit religion a few turns in.

<b>3</b> 62	Dale
	Thanks Dale it worked 🙂
	BTW the one line is
	bDisable1/bDisable
	with brackets in, you just cant see it Dales post (except in the quote screen) because of the forum formatting i think.

Maquiladora	Is there a way to prevent civs (AI and human) from changing their civics? I tried the ones in beginplayer but that just sets the starting civics as you say, and the ones in CIV4CivilizationInfos.xml seems to have at least the same effect.

Inventible 4, 2003, 12:10	Ouote:       Originally posted by Maquiladora         Got another question, kinda related to the WBS.         When i load up the short scenario i made and play i think 3 or 4 turns they always found a religion.         I even placed the city with WB and gave it a religion, for example id start the scen (no cities placed), place Moscow with the WB then give it Christianity religion, then 3 or 4 turns in itll say ive founded Taoism for example.         All civs have techs upto and including some from the modern era, but they all found different religions a few turns in.         Ive looked at your Desert War scen which i notice removes religion but i ideally want to keep religion in for now, but avoid the above somehow. Even the ones where i set the state religion in the WBS itll still found a new different religion a few turns in.         You already found a way but the easiest way to fix this is to open CvGameUtils.py and to replace:         Code:       def doffolyCity(self): return False         with
ERORI	Code: def doHolyCity(self): return True Locutus - Apolyton CS Co-Owner and Administrator Email/MSN: locutus@apolyton.net Trots da'w veur Twente bint! Maakt oons nich oet wat ie d'r van vindt! gdijedi7 <sup>Warlord</sup>	Okay. New question.
Warlord	WHERE is the WBS file?
	I've found a lot of other stuff, and I've found an icon that starts that scenario directly, but I can't find the WBS file itself.
	Greetings from Zardac the Great, Leader and President of the Zardacians. Our words are backed with NUCLEAR WEAPONS!

	The WBS file is the actual saved file from the world builder. In vanilla it was called a *.WorldBuilderSave (hence WBS file) and in Warlords it was a *.WarlordsBuilderSave. I can't remember what it's called for BTS but it'll be something along those lines.
Anne L	It'll be where ever you saved it to from the world builder. 😀
